Deployment Guide

1. Organization of Submission

docs

Contains deployment guides and Postman collection files.

seccommons

The common code module.

faya-api

The FAYA REST API module.

fundyield-api

The Fund Yield public REST API module.

sql

Contains sql scripts that used to create db schema (db user, table, procedure...).

test_data

Contains sql scripts that populate the db with test data.

README.md

The project documentation in Markdown format.

2. Prerequisites

Java 8 <http://www.oracle.com/technetwork/java/javase/downloads/jdk8-downloads-2133151.html>

Tomcat 8 <https://tomcat.apache.org/download-80.cgi>

Maven <https://maven.apache.org/download.cgi>

Oracle 11g <http://www.oracle.com/technetwork/database/database-technologies/express-edition/downloads/index.html>

3. Configuration

faya-api module

These are the most important variables that can be configured for **faya-api** module:

Name	Location	Description	Example value
operationScale	faya-api src/main/resources/constants.properties	The operation scale used by calculator engines	7
roundingMode	faya-api src/main/resources/constants.properties	The rounding mode used by calculator engines	4
oracle.url	faya-api src/main/resources/db.properties	The Oracle url	jdbc:oracle:thin:@localhost:49161:xe
oracle.username	faya-api src/main/resources/db.properties	The Oracle username	secyield
oracle.password	faya-api src/main/resources/db.properties	The Oracle password	passwd

Deployment Guide

For tests, make sure you provide the correct db credentials in `faya-api/src/test/resources/test-db.properties`:

```
oracle.driverClassName=oracle.jdbc.driver.OracleDriver
oracle.url=jdbc:oracle:thin:@localhost:49161:xe
oracle.username=test_secyield
oracle.password=password
```

fundyield-api module

These are the most important variables that can be configured for **fundyield-api** module:

Name	Location	Description	Example value
secyieldcontroller.maxNumberOfSecurityData	fundyield-api src/main/resources/constants.properties	The maximum number of security data to be returned by the API	100
getConfigApiPath	fundyield-api src/main/resources/application.properties	The path to get SEC configuration from faya-api	http://localhost:8081/faya-api/securitySECDataConfiguration
getSecuritySECDataApiPath	fundyield-api src/main/resources/application.properties	The path to get SEC data from faya-api	http://localhost:8081/faya-api/fayaFundAccountingSECYieldData
saveCalculatedSecuritySECDataApiPath	fundyield-api src/main/resources/application.properties	The path to save calculated SEC data from faya-api	http://localhost:8081/faya-api/calculatedFundAccountingSECYieldData
getCalculatedSecuritySECDataApiPath	fundyield-api src/main/resources/application.properties	The path to get calculated SEC data from faya-api	http://localhost:8081/faya-api/calculatedFundAccountingSECYieldData

4. Database Setup

Follow these steps to get the APIs running:

Use Oracle SQL Developer to connect to Oracle.

Run ***sql/create_user.sql***. This will create the two users ***secyield*** and ***test_secyield***.

Connect as ***secyield*** user, run ***sql/schema.sql*** and ***sql/procedures.sql***. This will create the

Deployment Guide

table structure and store procedures for user **secyield**.

Connect as **test_secyield** user, run **sql/schema.sql** and **sql/procedures.sql**. This will create the table structure and store procedures for user **test_secyield**.

In case you want to load some test data, run **test_data/clear.sql** and **test_data/test_data.sql**

5. Application Setup

In **seccommons** folder, run the following command:

```
$ mvn clean install
```

In **faya-api** folder, run the following commands:

```
$ mvn install:install-file -Dfile=lib/ojdbc6.jar -DgroupId=com.oracle -DartifactId=ojdbc6 -  
Dversion=11.2.0 -Dpackaging=jar  
$ mvn clean install  
$ mvn spring-boot:run
```

In **fundyield-api** folder, run the following commands:

```
$ mvn clean install  
$ mvn spring-boot:run
```

Unit tests are run by default, use **-DskipTests** parameter to skip unit tests:

```
$ mvn clean install -DskipTests
```

6. Unit Tests

In **seccommons**, **faya-api** and **fundyield-api** folder, run the following command:

```
$ mvn test
```

7. Verification

All input dates for the 2 REST APIs must follow this format: yyyy-MM-dd

The **test_data/test_data.sql** will insert sample data for date: **2014-12-01**

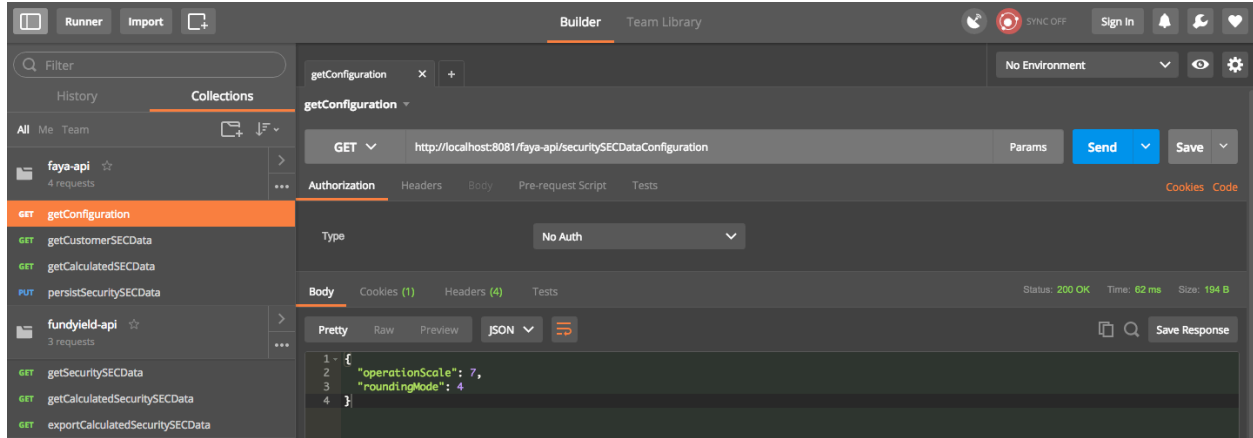

Open docs/faya-api.postman_collection.json and docs/fundyield-api.postman_collection.json in Postman application

Deployment Guide

faya-api

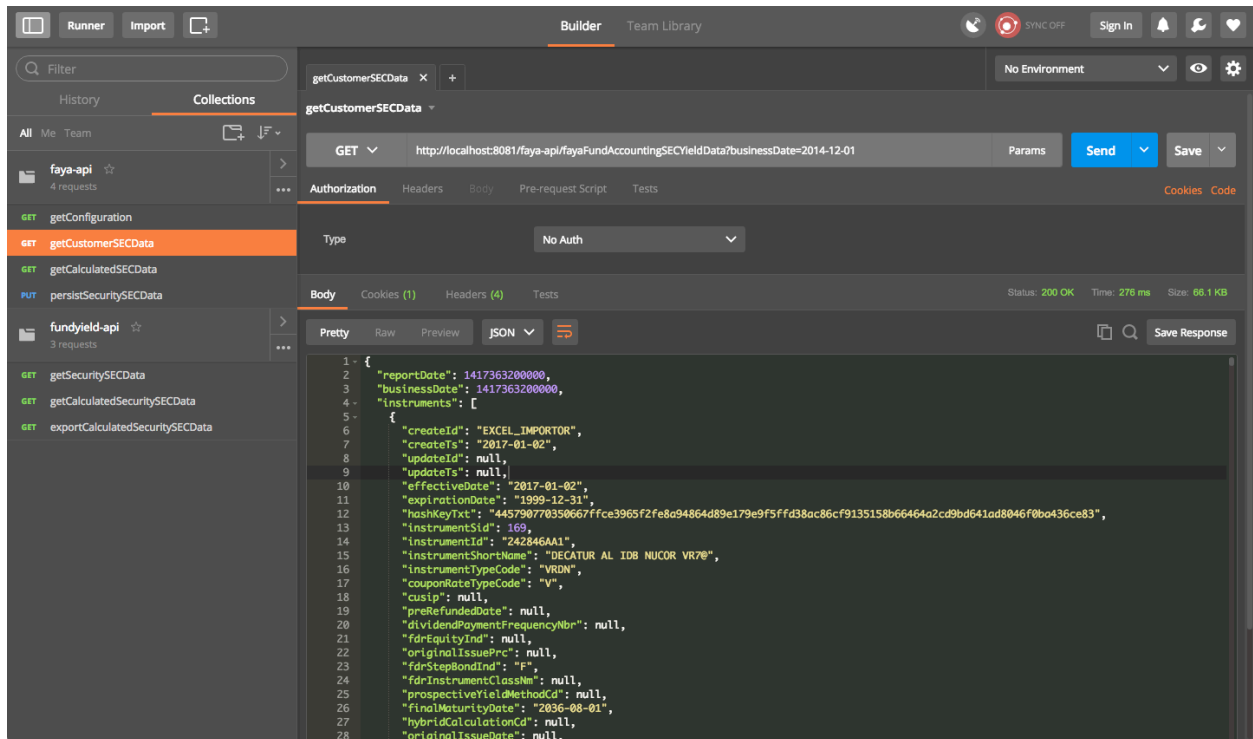

GET <http://localhost:8081/faya-api/securitySECDDataConfiguration>

Gets SEC security config for the calculations in engines:

GET <http://localhost:8081/faya-api/fayaFundAccountingSECYieldData?businessDate=2014-12-01>

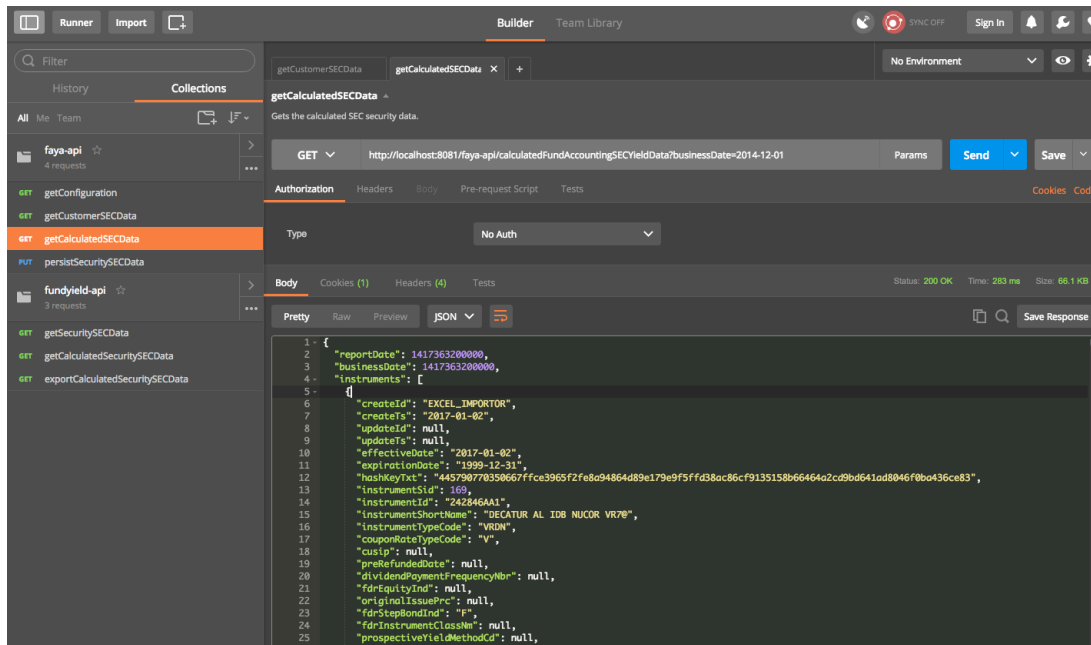

Gets the customer SEC security data:

Deployment Guide

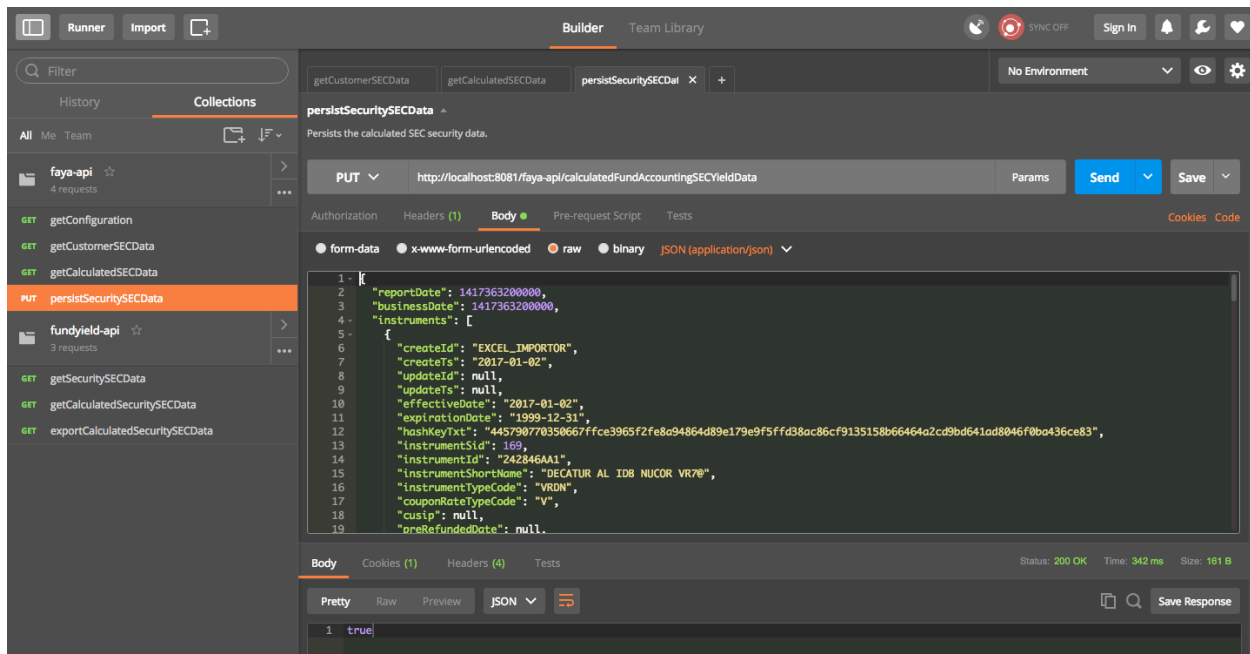

GET <http://localhost:8081/faya-api/calculatedFundAccountingSECYieldData?businessDate=2014-12-01>

Gets the calculated SEC security data:

PUT <http://localhost:8081/faya-api/calculatedFundAccountingSECYieldData>

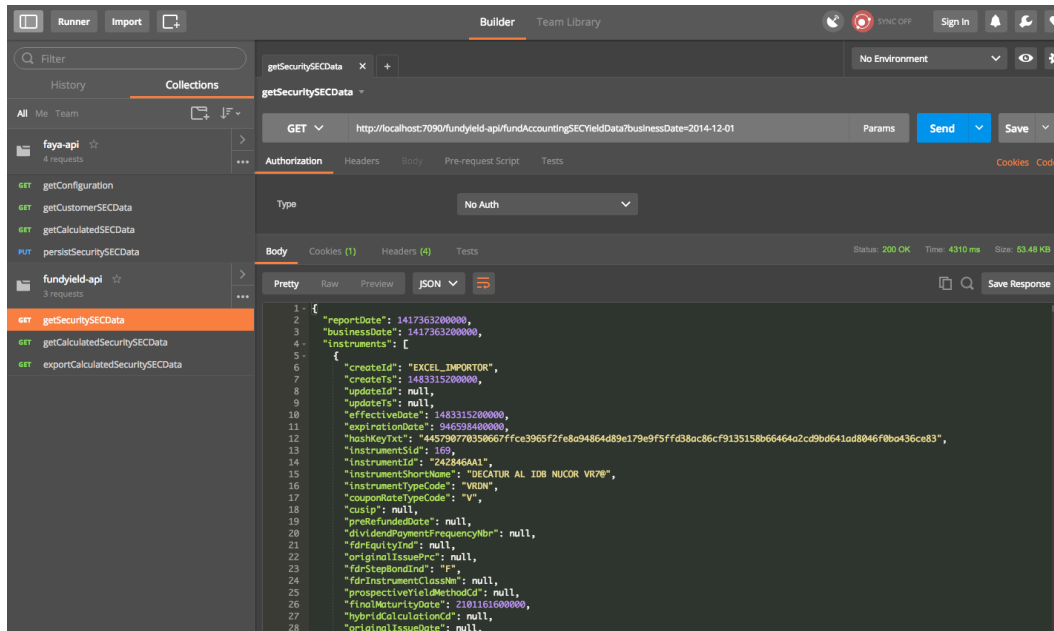

Persists the calculated SEC security data:

fundyield-api

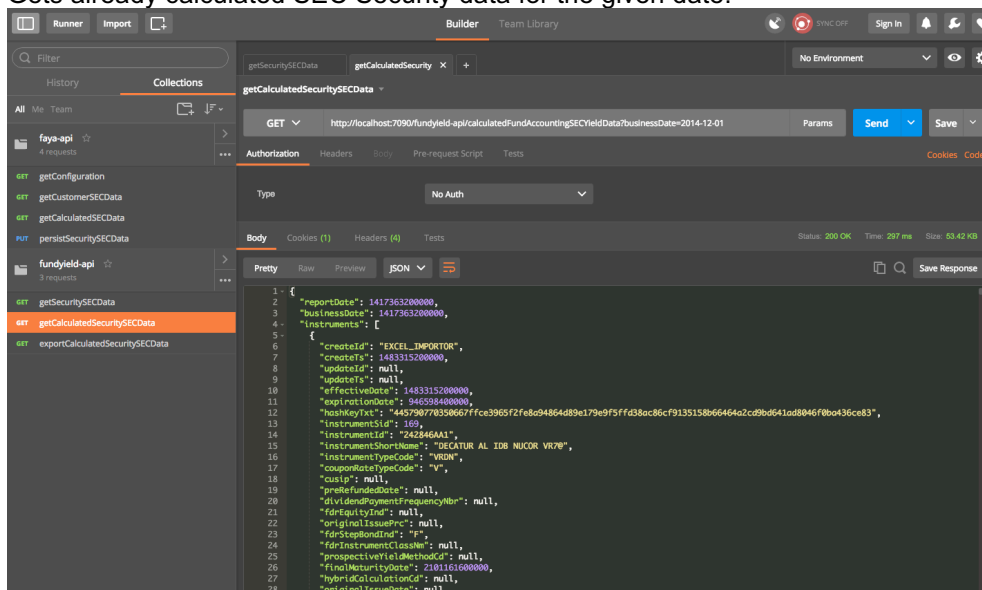

GET <http://localhost:7090/fundyield-api/fundAccountingSECYieldData?businessDate=2014-12-01>

Gets SEC Security data with the calculated data for the business date. The securities are also persisted using customer REST API:

GET <http://localhost:7090/fundyield-api/calculatedFundAccountingSECYieldData?businessDate=2014-12-01>

Gets already calculated SEC Security data for the given date:

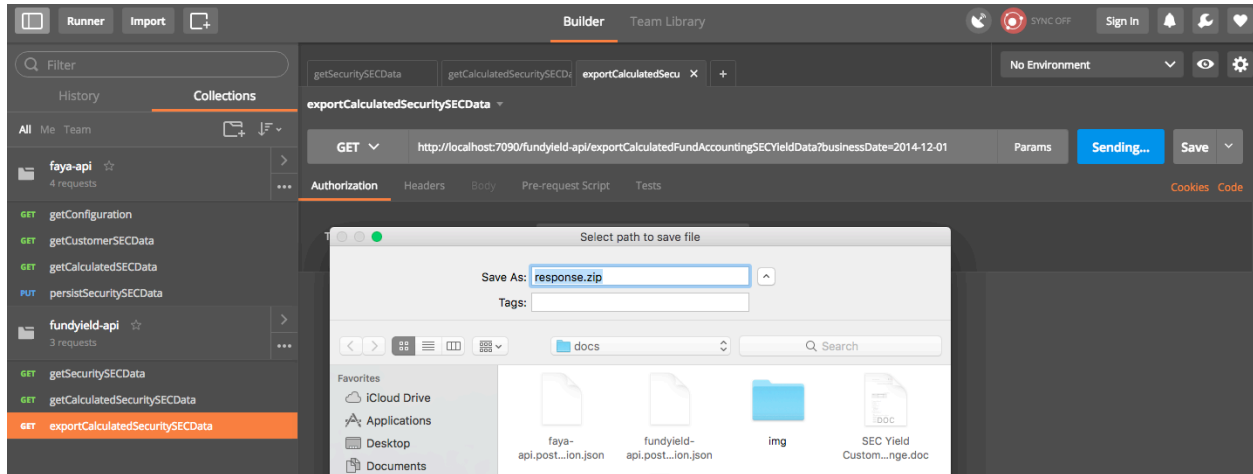

Deployment Guide

GET <http://localhost:7090/fundyield-api/exportCalculatedFundAccountingSECYieldData?businessDate=2014-12-01>

Exports calculated SEC Security data for the given date:

For downloading, click the arrow near the Send button and then click “Send and Download”.

In order to get the correct file name of the export, please test this url in a browser.

Sample Export file:
